Setting Up Your Liferay Project with Source Code

Prerequisites

Before starting your Liferay project, ensure you have:

- Java Development Kit (JDK) 8 or higher installed.
- Apache Maven installed for building and managing dependencies.
- A compatible database (MySQL, PostgreSQL, or others).
- Development IDE such as Eclipse or IntelliJ IDEA.

Downloading and Installing Liferay

- Visit the official Liferay downloads page:
<https://developers.liferay.com/downloads/>
- Choose the Liferay DXP or Liferay Portal Community Edition based on your needs.
- Download the bundle package suitable for your operating system.
- Extract the package to a preferred directory.
- Run the server using the provided startup scripts (`startup.sh` or `startup.bat`).

Creating a New Liferay Project

Liferay provides a Maven archetype to quickly scaffold a new plugin or module project:

```
```bash

mvn archetype:generate \

-DartifactId=my-liferay-project \

-DgroupId=com.example.liferay \

-DarchetypeArtifactId=maven-liferay-plugin \

-DarchetypeGroupId=com.liferay \

-DarchetypeVersion=7.4.0 \

-DinteractiveMode=false

```
```

This command creates a new project with the basic structure and source code templates.

Developing Custom Portlets and Modules

Understanding Liferay Modules

Liferay uses a modular architecture where functionalities are packaged as OSGi modules. These modules can be:

- Portlet modules: For creating web components.
- Service modules: For business logic and data services.
- Theme modules: For customizing appearance.
- Layout templates: For designing page layouts.

Creating Your First Portlet

- Use the Maven archetype to generate a portlet project.
- Implement your business logic within the portlet Java classes.
- Customize the `view.jsp` or other JSP files for UI.
- Deploy your portlet to Liferay server:

```
```bash
```

```
mvn clean package
```

```
```
```

- Access your portlet via the portal interface, usually under the "Add Application" menu.

Source Code Example: Simple Greeting Portlet

```
```java
```

```
package com.example.liferay.portlet;
```

```
import com.liferay.portal.kernel.portlet.bridges.mvc.MVCPortlet;
```

```
import javax.portlet.Portlet;
```

```
import javax.portlet.PortletException;
```

```
import javax.portlet.RenderRequest;
```

```
import javax.portlet.RenderResponse;

import java.io.IOException;

public class GreetingPortlet extends MVCPortlet {

 @Override

 public void doView(RenderRequest renderRequest, RenderResponse renderResponse)

 throws IOException, PortletException {

 String greeting = "Hello, welcome to Liferay!";

 renderRequest.setAttribute("greetingMessage", greeting);

 super.doView(renderRequest, renderResponse);

 }

}

...

```

And the corresponding JSP (`view.jsp`):

```
```.jsp

```

```
Greeting Portlet
<b>${greetingMessage}</b>

...

```

Setting Up a Liferay Development Environment

Before diving into source code development, establishing a proper environment is crucial. Here are the essential steps:

2.1 Prerequisites

- Java Development Kit (JDK): Liferay 7.x supports Java 8 or higher.
- Database: MySQL, PostgreSQL, or other supported databases.
- Build Tools: Maven or Gradle, depending on project configuration.
- Integrated Development Environment (IDE): Eclipse, IntelliJ IDEA, or Visual Studio Code.
- Liferay Bundle: Official Liferay bundles are pre-configured packages with server and portal installed.

2.2 Installing Liferay Bundle

Download the latest Liferay bundle from the official website, such as:

- Liferay DXP (Commercial)
- Liferay Community Edition (CE)

Extract the bundle and run the server:

```
```bash
```

```
cd liferay-ce-
```

```
./gradlew clean deploy
```

```
```
```

or for Windows:

```
```cmd
```

```
gradlew.bat clean deploy
```

```
```
```

Once the server is running, access the portal via `http://localhost:8080` and proceed with customization.

Creating a Liferay Project with Source Code

Developing custom functionalities involves creating portlets, themes, hooks, or modules. This section focuses on building a modular portlet project, which is the most common extension point.

2.1 Using Liferay Workspace

The recommended approach is to create a Liferay Workspace, a development environment that manages multiple modules.

Steps:

- Create a Workspace:

Using Liferay Blade CLI:

```
```bash

blade create -t theme -p com.example.mytheme my-theme

```
```

Or, create a workspace:

```
```bash

blade init my-liferay-workspace

```
```

- Add a Module (Portlet):

```
```bash

cd my-liferay-workspace

blade create -t portlet -p com.example.myportlet my-portlet

```
```

This creates a structured project with predefined configurations, making it easier to develop, deploy, and maintain.

2.2 Understanding the Source Code Structure

A typical portlet project contains:

- ``src/main/java/``: Java classes, portlet controllers, services.
- ``src/main/resources/``: Configuration files, ``portlet.xml``, ``liferay-portlet.xml``.
- ``src/main/webapp/``: JSPs, CSS, JavaScript, images.
- ``build.gradle``: Build script with dependencies and build instructions.

2.3 Developing Custom Portlets

Key steps:

- Define Portlet Class:

```
```java

package com.example.myportlet;

import com.liferay.portal.kernel.portlet.bridges.mvc.MVCPortlet;

import javax.portlet.Portlet;

public class MyPortlet extends MVCPortlet {

 // Override methods or add custom logic

}

```
```

- Configure `portlet.xml` and `liferay-portlet.xml` to register the portlet.
- Create JSP Views for rendering UI.
- Add Dependencies: For example, Liferay MVC frameworks, API libraries.

2.4 Deploying the Portlet

Build the project:

```
```bash

./gradlew build

```
```

Deploy the resulting `.jar` or `.war` file into the Liferay server:

```
```bash
```

```
./gradlew deploy
```

```
```
```

Access the portal, navigate to the Site Builder, and add the custom portlet to a page.

Best Practices for Liferay Development

Creating a scalable, maintainable Liferay project involves adhering to best practices:

3.1 Modular Design

- Utilize Liferay's modular architecture to break down functionalities into manageable modules.
- Follow OSGi best practices for service registration and dependency management.

3.2 Use of Service Builder

- Leverage Liferay Service Builder to generate persistence and service layers, reducing boilerplate code.
- Define entities in `service.xml`, generate code, and customize as needed.

3.3 Version Control and CI/CD

- Maintain source code in repositories like Git.
- Automate build, testing, and deployment pipelines with Jenkins or GitHub Actions.

3.4 Performance Optimization

- Cache data where appropriate.
- Minimize server calls and optimize database queries.
- Use lazy loading for heavy resources.

3.5 Security

- Implement proper user permissions.
- Sanitize inputs.
- Use HTTPS and secure sessions.

Sample Source Code Snippet: A Basic Portlet

Here's an example of a minimal portlet class:

```
```java

package com.example.myportlet;

import com.liferay.portal.kernel.portlet.bridges.mvc.MVCPortlet;

import javax.portlet.Portlet;

public class HelloWorldPortlet extends MVCPortlet {

 // Custom logic can be added here

}

```
```

And a simple JSP view (`view.jsp`):

```
```jsp

Hello Liferay
Hello, Welcome to Liferay Portlet!

```
```

This forms the foundation for building more complex portlets with user interactions, data integration, and dynamic content.
