Case Study 1: Pricing a Product with GST/HST

Suppose a retailer in Ontario is selling a product with a base price of CAD 100. To determine the final price including HST (13%), the calculation would be:

- Final Price = Base Price + (Base Price × HST Rate)
- Final Price = $100 + (100 \times 0.13) = \text{CAD } 113$

Understanding such calculations ensures accurate pricing strategies compliant with Canadian tax laws.

Case Study 2: Calculating Loan Payments Using Amortization

A business wants to finance equipment costing CAD 50,000 over 5 years at an annual interest rate of 6%. Using the amortization formula, the monthly payment can be calculated, allowing the business to plan cash flows accordingly.

Case Study 3: Analyzing Profit Margins

A Canadian manufacturer assesses its costs:

- Fixed costs: CAD 20,000/month
- Variable costs per unit: CAD 50
- Selling price per unit: CAD 80

Calculating the breakeven point:

- Breakeven units = Fixed Costs / (Selling Price - Variable Cost) = $20,000 / (80 - 50) = 20,000 / 30 = 667$ units

This helps in setting sales targets and pricing strategies.
