Traditional Timber Construction

Historically, timber has been one of the earliest building materials used by humans, dating back thousands of years. Traditional timber architecture focused on straightforward post-and-beam systems, timber framing, and load-bearing walls, primarily used for residential and small-scale public buildings. These methods prioritized durability, ease of construction, and material availability.

Transition to Modern Timber Engineering

The 20th century saw significant technological advancements in timber engineering, including the development of engineered wood products such as glulam (glued laminated timber), CLT (cross-laminated timber), and LVL (laminated veneer lumber). These innovations allowed for larger, stronger, and more precise structural elements, enabling taller and more complex timber structures.
